CONTROL-M AND RISE: READY FOR THE FUTURE OF SAP S/4HANA INTEGRATION

As enterprises accelerate their digital transformation journeys, many are turning to **RISE with SAP S/4HANA** to simplify their path to the cloud while preserving business continuity. RISE with SAP is SAP's strategic offering that bundles cloud infrastructure, managed services, and SAP S/4HANA into a single subscription model.

But as SAP landscapes grow more complex—with a mix of on-premises, cloud, and hybrid environments—the need for seamless orchestration and intelligent automation has never been greater. **Control-M** is a proven, SAP-certified application and data workflow orchestration platform that is now fully **compatible with RISE with SAP** and **integration-ready with SAP S/4HANA**.

Control-M: Purpose-Built for Modern SAP Workflows

Control-M empowers enterprises to orchestrate and monitor business-critical workflows across SAP and non-SAP systems with a single, unified platform. As organizations transition from SAP ECC to SAP S/4HANA—either on-premises or through RISE with SAP—Control-M ensures that scheduling, automation, and monitoring capabilities remain robust, flexible, and aligned with modern best practices.

Whether it's traditional ABAP-based jobs, cloud-native extensions, or third-party integrations, Control-M manages them all—without relying on custom scripts or siloed tools.

RISE with SAP Compatibility: Simplifying the Move to Cloud ERP

While RISE with SAP streamlines procurement and lowers TCO, it also introduces a shared responsibility model, making **automation and visibility into background jobs even more essential**.

Control-M is designed to integrate directly with **SAP S/4HANA under the RISE with SAP model**, ensuring that organizations retain full control over their scheduled jobs, dependencies, and business workflow, even as SAP infrastructure and services are managed by SAP or Hyperscalers.

Seamless Integration with SAP S/4HANA Features

Control-M supports the full range of SAP S/4HANA features and architecture elements, including:

- **ABAP jobs**
- **SAP Business Warehouse (BW) processes**
- **Data archiving**
- **SAP HANA and Fiori-based applications**
- **SAP BTP extensions and API-based workflows**
- **Hybrid and multi-cloud environments (including OCI, AWS, Azure)**

With Control-M, users can define and manage dependencies between SAP S/4HANA jobs and external workflows—whether they're running in a data lake, cloud integration platform, or third-party ERP module.

Future-Ready: Clean Core and SAP BTP Integration

As enterprises adopt **clean core strategies**—keeping custom logic outside the core S/4HANA system, Control-M's **support for SAP BTP and API-based orchestration** becomes critical. Businesses can now automate workflows across SAP BTP extensions and custom applications, maintain upgrade readiness, and drive agility across their IT operations.

This makes Control-M an ideal partner for organizations embracing **side-by-side innovation** with SAP BTP, as well as cloud-native integrations.

Key Benefits for SAP-Centric Enterprises

- **Unified orchestration** of SAP and non-SAP workflows across cloud, hybrid, and on-prem environments
- **Out-of-the-box support** for SAP ECC, SAP S/4HANA, and RISE with SAP
- **End-to-end visibility** and SLA management from a single control plane
- **Faster troubleshooting and reduced downtime** through proactive monitoring and alerts
- **Support for clean core principles** via SAP BTP and API integrations

The move to **SAP S/4HANA and RISE with SAP** is a strategic imperative for many organizations—but the transition requires careful orchestration, especially as business processes become more distributed and data-driven.

With Control-M, enterprises can confidently modernize their SAP environments, maintain full control over their critical workloads, and unlock the full value of SAP's intelligent ERP—now and in the future.
