# **GOOGLE NATURAL LANGUAGE API AND SENTIMENT ANALYSIS**

Here we discuss Natural Language processing using the Google Natural Language API. Our goal is to do sentiment analysis.

#### Definition

**Sentiment analysis** means seeing whether what someone writes is positive or negative. Business can use this to look at Twitter, Yelp, or whoever offers a API and then change their marketing, practices, or even reach out to the person who has complained about their brand and offer to fix what has irked them so.

To do sentiment analysis you could write your own code or use any of the many cloud APIs from different vendors and pay for the service. Writing it yourself would save you money. You just need to understand concepts like **bag of words** and master the <u>NLP APIs</u> in a deep learning ML library like Torch.

Sign up for a Google Cloud free trial <u>here</u> and enable the Google Natural Language Processing (NLP) API. This gives you \$300 credit that you can use in 365 days. Don't worry, they promise they will not bill your credit card without asking you first. So you should be able to use it for free for this tutorial and other tutorials that we will write on Google Cloud.

## Setup

You need to install the Google cloud utilities on your system.

Download the Google cloud utilities and SDK following <u>these instructions</u> to set it up, but **STOP** at the **gcloud init** step since we are using the NLPTutorial, which is already partially set up.

### **Enable API for project**

Go to the <u>Google console</u> and pick the **NLPTutorial** project, which should already be there. if it is not you have not signed up and enables the NLP trial.

#### Go to Enable APIs and Services.

Enable both **Natural Language** processing and Google Service Mangement APIs by typing the first few letters in this screen and picking each:

If you cannot find that screen go to the URL directly:

//console.developers.google.com/apis/library/cloudresourcemanager.googleapis.com/?proj
ect=(name it shows on as Project id) like this:

setup correctly, the screen should look like this:

=	Google APIs S NLPT	utorial 👻	٩					ii Ø Ø		: (2)
API	APIs & Services	Dashboard	+ ENABLE APIS AND	SERVICES						
\$	Dashboard					÷.				
丗	Library	API		✓ Requests	Errors	Error ratio	Latency, median	Latency, 98%		
0+	Credentials	Google Cloud Nature	iral Language API	2	0	0%	66 ms	257 ms	Disable	÷
		Google Service Management API		1	1	100%	393 ms	519 ms	Disable	ł
	BigQuery API				<u></u>	12	-	12 <u>1</u>	Disable	
		Google Cloud APIs		1 <u>11</u>	-	12		13 <u>44</u>	Disable	ł
		Google Cloud Datastore API Google Cloud Resource Manager API		<u></u>	1	100		10 <u>11</u>	Disable	ł
				100 C	-	<u> </u>	<u> </u>	12	Disable	ł
		Google Cloud SQL		1 <u>11</u>	-	<u></u>	<u> </u>	19 <u>11</u>	Disable	ł
		Google Cloud Store	age	<u>199</u>	-	<u></u>	<u> </u>	12 <u>1</u>	Disable	ł
		Google Cloud Store	age JSON API	<u>199</u>	-	1 <u>-</u>	_	12 <u>1</u>	Disable	ł
		Stackdriver Debug	ger A PI		-	1 <u>—</u>	-	18 <u>44</u>	Disa ble	ł
		Stackdriver Loggin	g API		<u></u>		<u> </u>	10 <u>11</u>	Disable	ł
		Stackdriver Monito	ring API		1	12		13 <u>44</u>	Disable	a .
		Stackdriver Trace A	API	_	-	_	_	_	Disable	8

Download a service account key in JSON format following these directions.

Set the GOOGLE\_APPLICATION\_CREDENTIALS environment variable to point to it:

export GOOGLE\_APPLICATION\_CREDENTIALS=/home/walker/Documents/nlp/google.json

#### **Run Sentiment Analysis**

Now we will test this by writing a complaint about a restaurant we visited. Type:

```
gcloud ml language analyze-sentiment --content="The service in your restaurant is terrible. My wife and I are never coming back."
```

As you can see the **sentiment** is negative (< 0). To understand how negative you need to study what **magnitude and score** mean.

```
{
    "documentSentiment": {
        "magnitude": 1.2,
        "score": -0.6
    },
    "language": "en",
    "sentences":
}
```

Now write something positive:

gcloud ml language analyze-sentiment --content="We love your restaurant and will recommend it to all our friends."

Now the sentiment is positive (> 0).

```
{
    "documentSentiment": {
        "magnitude": 0.9,
        "score": 0.9
    },
    "language": "en",
    "sentences":
}
```

Next you could try to the same thing using Python following <u>the instructions</u> provided by Google.
